

Profile

My professional work experience in the web industry has encompassed working in small and large creative teams, on-site with clients in multinational organisations and government departments, and remote teams delivering successful project outcomes.

Hired as a “CSS Developer” (a unique role at the time), with my passion for technology, I quickly expanded this role into working closely with PMs, BAs, Graphic Designers, Back-end Developers to facilitate streamlining and optimising the full-service agency model.

This ultimately led to a role as Head of Systems Administration, overseeing the smooth running of technological and project team operations. More recently this experience has allowed me to spend time travelling while working with several open-source project teams and freelancing remotely with smaller project teams.

Key Skills

- Hand coding semantic, clean and well organised code producing responsive, usability focused, highly accessible and highly optimised websites and applications
- Building customised technology-specific front-ends and user experience around enterprise, open source and bespoke CMS technologies
- Working in creative teams to build novel, optimal and intuitive interfaces and user experiences meeting challenging client business requirements and coordinating collaborative demonstrations, pitches and workshops to ultimately devise successful solutions
- Identifying, adopting and juggling technologies and technical infrastructures, from streamlining dev ops (making the team’s life easier) to designing and building out system architectures to meet client hosting requirements
- Communicating, training and conveying technological concepts to individuals and teams of staff, clients, and end users by gauging audience knowledge and understanding, and adapting terminology and explanatory methods

Toolset

Languages & Libraries

HTML, CSS, SASS, JavaScript, JSON, bash, markdown
